

Water & Living Things

Let's Explore!

1

What happens to a plant if you don't water it for a long time?

2

What do animals need water for?

3

Where does freshwater for plants and animals come from?

BIG IDEA

Water is essential for living things.

Every plant and every animal needs water — every single day. Water helps living things survive, grow, and stay healthy. Without it, life on Earth would not be possible.

SURVIVE

GROW

STAY HEALTHY

Why do plants need water?

1

Grow and stay healthy

Water keeps every cell working so plants can grow strong.

2

Move nutrients

Water carries food and minerals to leaves, stems, and flowers.

3

Make food (photosynthesis)

Leaves mix water, sunlight, and air to make plant food.

4

Stand tall

Water fills the plant so it stays firm and doesn't wilt.

Why do animals need water?

Stay hydrated

Water keeps blood and body fluids moving.

Body works properly

Every organ needs water to do its job.

Digest food

Water helps break down what animals eat.

Cool down or warm up

Water helps regulate body temperature.

WHAT IF?

What happens without enough water?

Plants droop and stop growing

Animals get weak and sick

SOURCES

Where do living things get freshwater?

Rain

Water falling from clouds.

Rivers

Flowing freshwater streams.

Lakes

Large freshwater bodies.

Groundwater

Water stored under the soil.

COMPARE

How do plants and animals get freshwater?

Plants

Absorb water through roots from the soil — the soil holds rainwater and groundwater.

Rain → Soil → Roots → Plant

Animals

Drink from rivers and lakes, eat foods with water, or take it in from moist environments.

Rain → River → Animal drinks

PROCESS

Water and plants: how water moves.

1

In the soil

Water waits in the soil.

2

Roots absorb

Roots soak it up.

3

Up the stem

Water rises through the stem.

4

Leaves make food

Leaves use water to grow.

How animals get water

Drink directly

From rivers, lakes, and ponds.

Eat juicy foods

Fruits and plants full of water.

Moist environments

Frogs and amphibians absorb through skin.

Multimedia ideas

Bring the lesson to life with visuals and short animations.

- ✓ Pictures of plants and animals using water
- ✓ Diagram of water absorption by plant roots
- ✓ Photos of rain, rivers, lakes, groundwater
- ✓ Short animation on water's importance
- ✓ Simple water-source flowchart

ACTIVITY 1

Where does the water come from?

Match each scenario to its freshwater source.

1 A plant gets water from the sky.

→ **Rain**

2 A deer drinks from flowing freshwater.

→ **River**

3 A fish lives in freshwater surrounded by land.

→ **Lake**

4 A plant's roots pull water from under the soil.

→ **Groundwater**

ACTIVITY 2

Why do they need water?

Match each living thing to what water does for it.

Plant

"For growth and survival!"

Dog

"For hydration and body function!"

Tree

"For growth and moving nutrients!"

Frog

"For survival and body work!"

ASSESSMENT

Check your understanding

1. Why is water important to living things?

A Helps them survive and grow

B Makes them nonliving

C Replaces sunlight completely

D Prevents all diseases

2. Which is a freshwater source?

A Ocean

C River

C Saltwater pool

D Sea

3. Which plant part absorbs water from the soil?

A Flower

B Leaf

C Root

D Fruit

Almost there!

4. Which is an example of groundwater?

A Water stored beneath the ground

C Water vapor in clouds

B Water in the ocean

D Saltwater in the sea

5. Which statement is TRUE?

A Only animals need water

C Plants and animals need water

B Only plants need water

D Living things can survive without water

**Thank you
for learning!**
