

Plant & Animal Habitats

LEARNING COMPETENCIES

The learners can:

- Classify common Philippine plants and animals based on their terrestrial, aquatic, and aerial habitats.
 - Explain how plants and animals depend on their habitats for food, water, and shelter.
- 

LET'S EXPLORE!

Where do they live?

01

Where does a fish live?

02

Where can we find a monkey?

03

Where do birds usually spend time?

DEFINITION

What is a Habitat?

A habitat is the natural place where plants and animals live and grow. It gives them everything they need to survive.

Habitats provide:

● Food

● Water

● Shelter

● Space

TYPE 01 • LAND

Terrestrial Habitat

A habitat found on land, where plants root in soil and animals walk, run, or climb.

Where you find it:

Forests • Grasslands • Gardens • Farms

Philippine examples:

Mango tree

Coconut tree

Carabao

Monkey

Dog

TYPE 02 • WATER

Aquatic Habitat

A habitat found in or around water, where organisms live in rivers, lakes, or seas.

Where you find it:

Rivers • Lakes • Ponds • Seas •
Mangroves

Philippine examples:

Fish

Seaweed

Water lilies

Crabs

TYPE 03 • AIR

Aerial Habitat

Aerial Habitat

The open sky, where some animals spend much of their time moving, feeding, or living in the air.

Where you find it:

Open skies above forests, fields, and coasts

Philippine examples:

Eagles

Swallows

Bats

Butterflies

AT A GLANCE

Plants & Animals by Habitat

Habitat	Plants	Animals
Terrestrial	Mango tree, Coconut tree, Grass	Carabao, Monkey, Dog
Aquatic	Seaweed, Water lilies, Mangroves	Fish, Crab, Shrimp
Aerial	—	Eagle, Swallow, Bat, Butterfly

01 HOW ORGANISMS DEPEND ON HABITATS

Food

Animals depend on their habitats to find the food they need to grow strong.

For example:

A bird finds fruits, seeds, or insects hidden among the leaves of its habitat.

02 HOW ORGANISMS DEPEND ON HABITATS

Water

All living things need water to live, drink, and grow.

For example:

Fish depend on rivers, lakes, and seas as their living environment.

03 HOW ORGANISMS DEPEND ON HABITATS

Shelter

Animals use different parts of their habitat to keep safe and warm.

For example:

A bird uses tree branches and leaves to build a cozy nest for its eggs.

04 HOW ORGANISMS DEPEND ON HABITATS

Space

Plants need enough space to spread their roots, stems, and leaves.

For example:

A young plant grows in an open area where its roots reach into the soil and its leaves stretch to the sun.

ACTIVITY 01

Where Does It Live?

Look at each organism and choose its habitat: Terrestrial, Aquatic, or Aerial.

Fish

✓ **Aquatic**

Monkey

✓ **Terrestrial**

Eagle

✓ **Aerial**

Mango Tree

✓ **Terrestrial**

Crab

✓ **Aquatic**

Butterfly

✓ **Aerial**

What Does It Need?

What does each organism get from its habitat? Match the situation to Food, Water, Shelter, or Space.

Shelter

A bird uses a tree to build a nest.

Water

A fish lives in a river.

Food

A monkey eats fruits in the forest.

Space

A plant grows in an open field.

Check Your Learning

1 What is a habitat?

A. A type of animal

B. The natural place where an organism lives

C. A kind of food

D. A weather pattern

2 Which is an example of a terrestrial habitat?

A. Ocean

B. River

C. Forest

D. Sky

3 Which organism commonly lives in an aquatic habitat?

A. Fish

B. Monkey

C. Eagle

D. Mango tree

Check Your Learning

1 Which animal can be found in an aerial environment?

A. Carabao

B. Eagle

C. Crab

D. Seaweed

2 Why do plants and animals depend on their habitats?

A. Habitats provide resources needed for survival

B. Habitats give them names

C. Habitats make them colorful

D. Habitats are just decorations

Thank you!
