

Life Cycles of Living Things

LEARNING COMPETENCIES

At the end of the lesson, learners should be able to:

Compare the life cycles of selected living things, such as mammals, birds, plants, and insects, and describe how growth and reproduction help living things continue their kind.

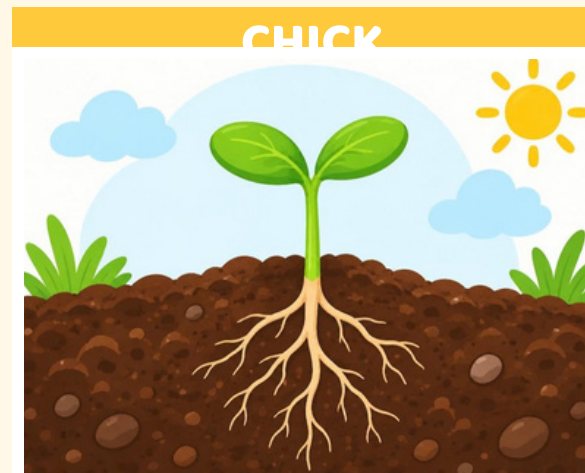

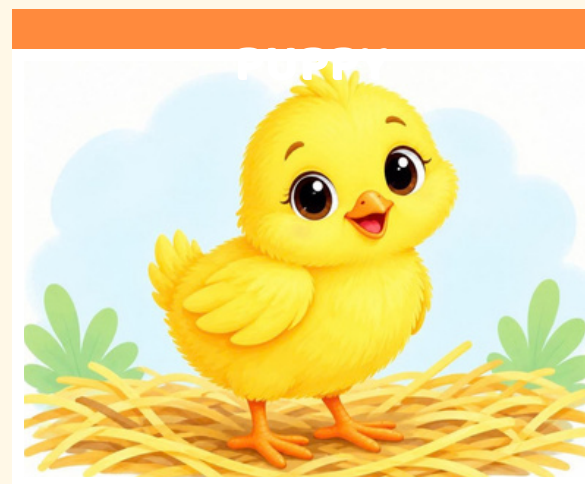

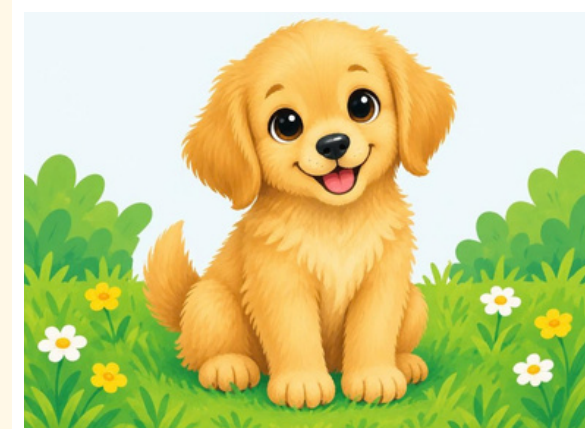

Let's Explore Growth!

**Have you ever seen a baby
grow into an adult?**

**Do all living things grow the
same way?**

Changes like these are called life cycles.

SEEDLING

DEFINITION

What is a Life Cycle?

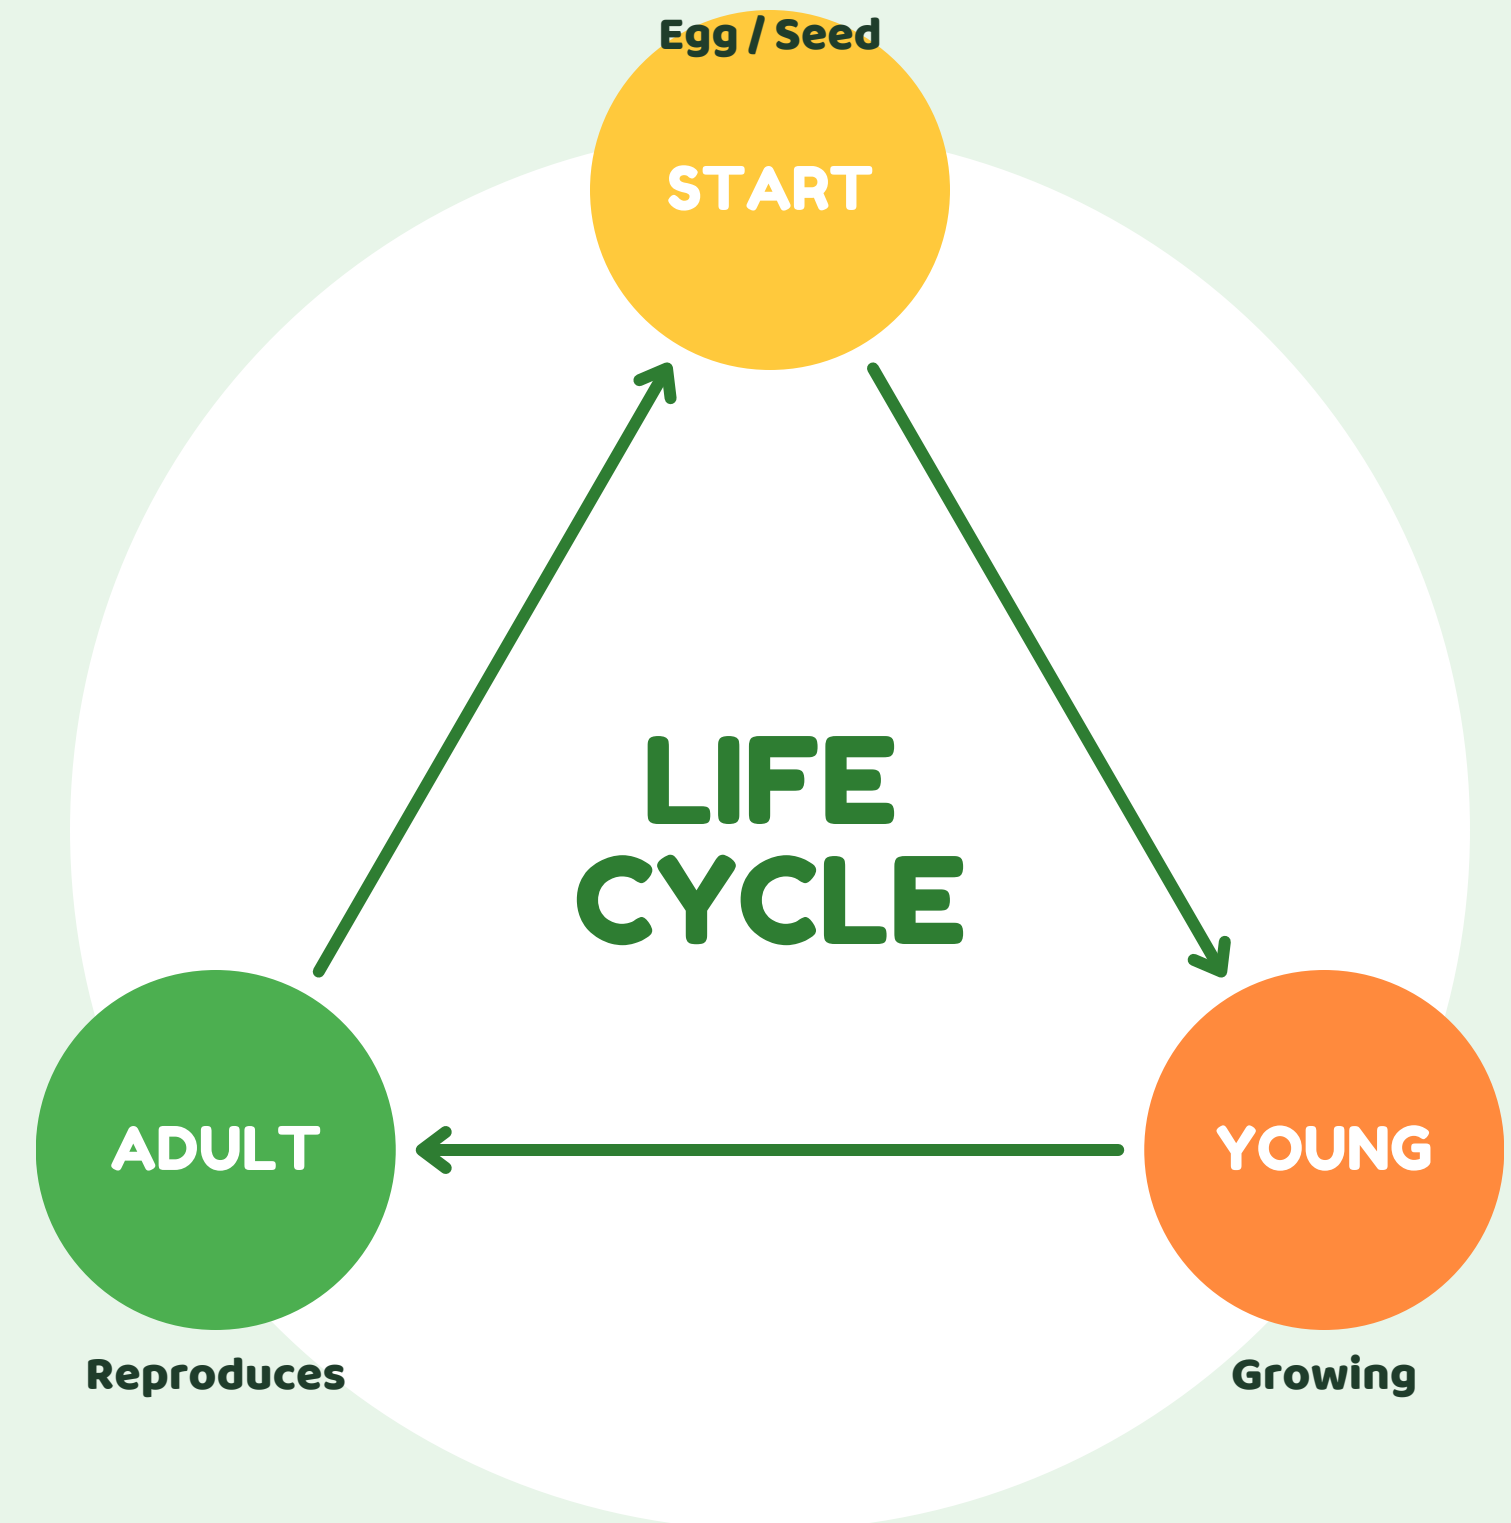

A life cycle is the series of stages a living thing goes through as it grows and develops.

**Different organisms,
different cycles**

Puppies, chicks, seeds, and caterpillars each grow in their own way.

**Some simple,
some complex**

A dog grows steadily, but a butterfly transforms completely.

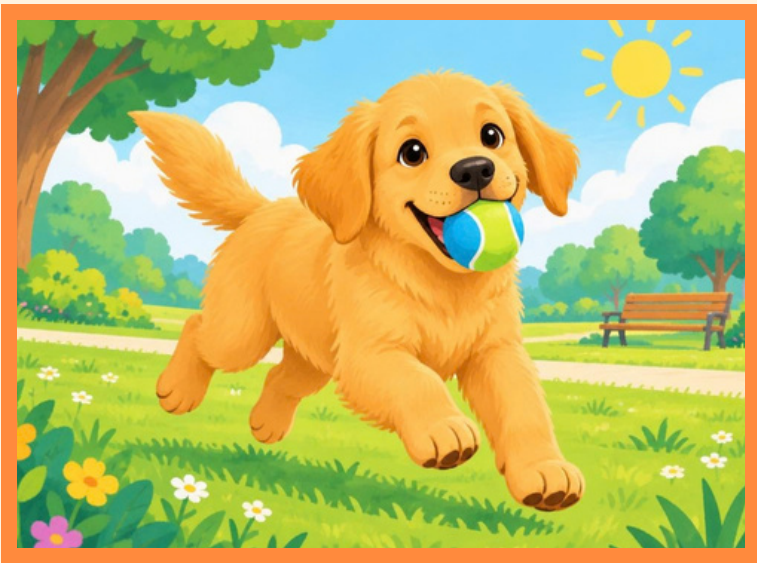

Life Cycle of a Dog

Mammals give birth to live young. Puppies drink milk from their mother, grow quickly, and slowly develop into adult dogs that can have puppies of their own.

PUPPY

Newborn, drinks milk, cuddly and playful.

YOUNG DOG

Grows fast, learns and explores.

ADULT DOG

Fully grown, can have puppies.

Other mammals:

CAT

COW

HUMAN

...all give live birth

Life Cycle of a Chicken

Birds reproduce by laying eggs. A mother hen keeps her eggs warm until they hatch. A tiny chick grows into a young chicken and finally an adult that lays eggs of its own.

EGG

Laid and kept warm.

CHICK

Hatches, fluffy and yellow.

YOUNG

Grows feathers, gets bigger.

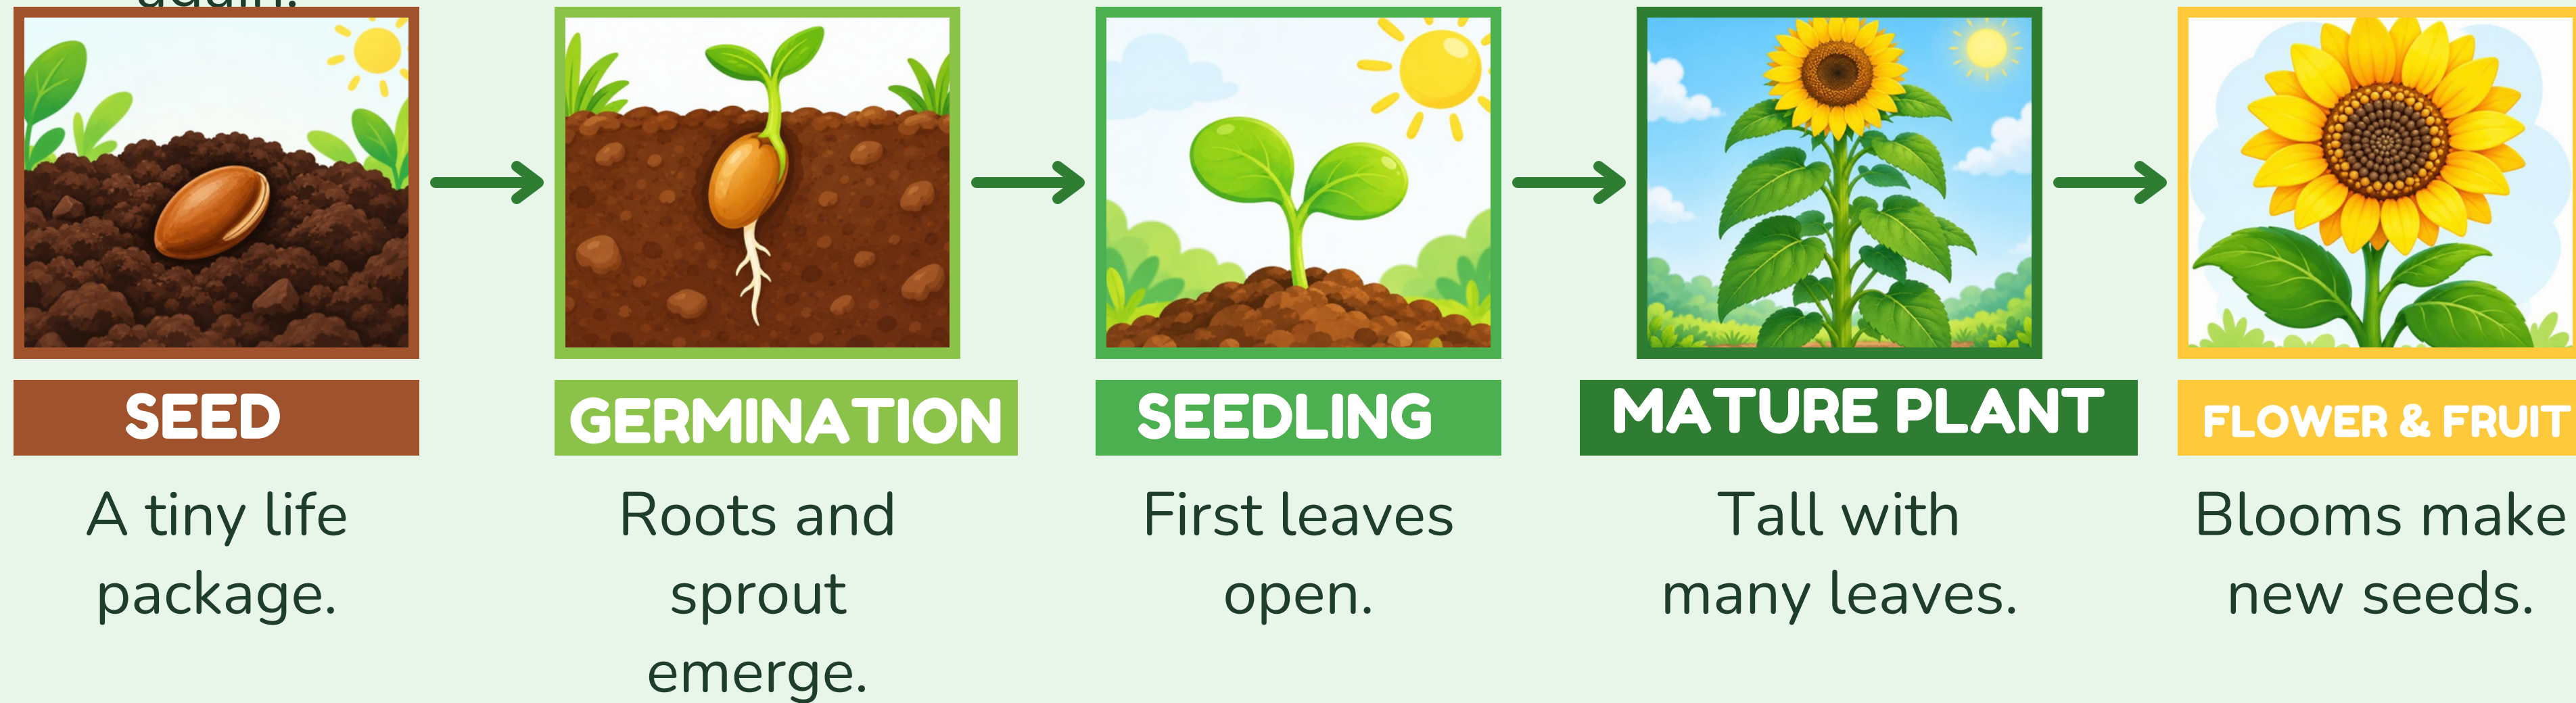

ADULT HEN

Lays eggs.

Birds reproduce by laying eggs.

Life Cycle of a Flowering Plant

Plants reproduce with seeds. A seed sprouts, grows leaves, and matures into a plant that blooms flowers. The flowers make fruit and new seeds — and the cycle starts again!

Seeds are the reproductive units of flowering plants.

Life Cycle of a Butterfly

Butterflies go through METAMORPHOSIS — a complete change in shape! Each stage looks totally different from the last.

EGG

Tiny egg on a leaf.

LARVA

Hungry caterpillar!

PUPA

Chrysalis — big change inside.

ADULT

Butterfly with beautiful wings.

Each stage looks completely different — that's metamorphosis!

Comparing Life Cycles

MAMMAL

Live birth

Dog, cat, cow,
human

BIRD

Lays eggs

Chicken, duck,
eagle

PLANT

**Grows from
seeds**

Sunflower, apple
tree

INSECT

**Eggs +
metamorphosis**

Butterfly, bee,
beetle

✓ **ALL LIVING THINGS...**

grow, develop, and reproduce to continue their kind.

✦ **BUT EACH IS UNIQUE**

...in the stages they pass through and how they reproduce.

Growth, Development, & Reproduction

GROWTH

Getting bigger in size.

*e.g. A puppy grows
into a bigger dog.*

DEVELOPMENT

Changing and

maturing.
*e.g. A caterpillar
becomes a butterfly.*

REPRODUCTION

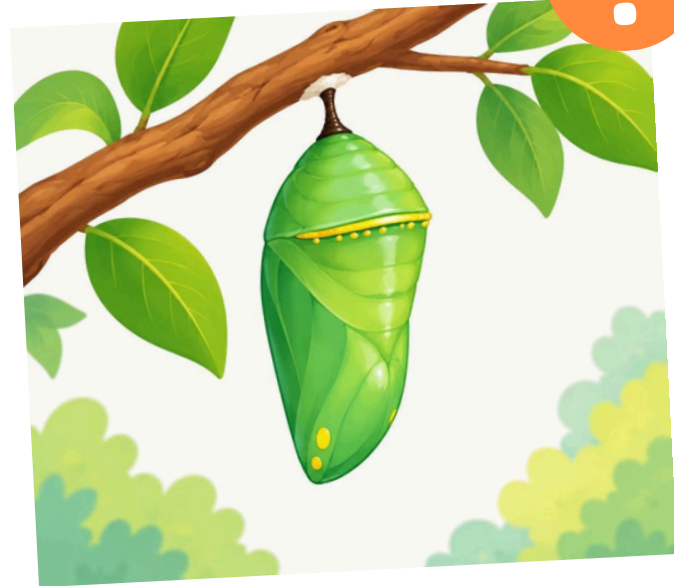

Making new living

things.
*e.g. An adult hen lays
eggs that hatch.*

ACTIVITY 1

Arrange the Life Cycle!

✚ Can you put these butterfly stages in the correct order?

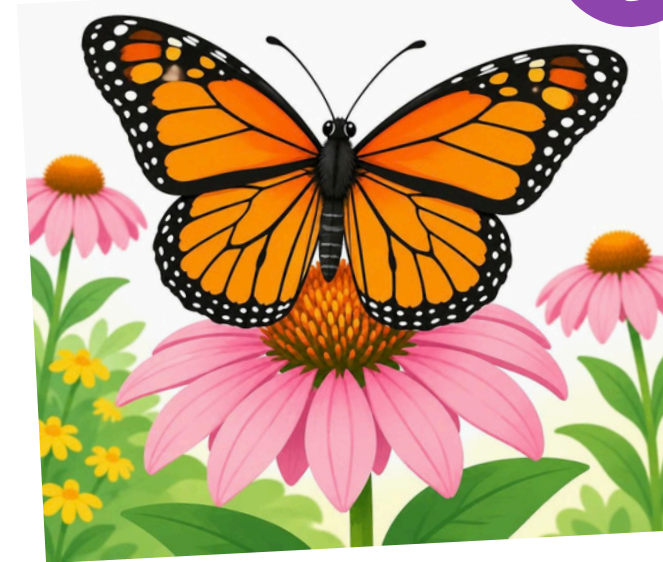

Pupa

Stage # ___

Egg

Stage # ___

Adult Butterfly

Stage # ___

Larva (Caterpillar)

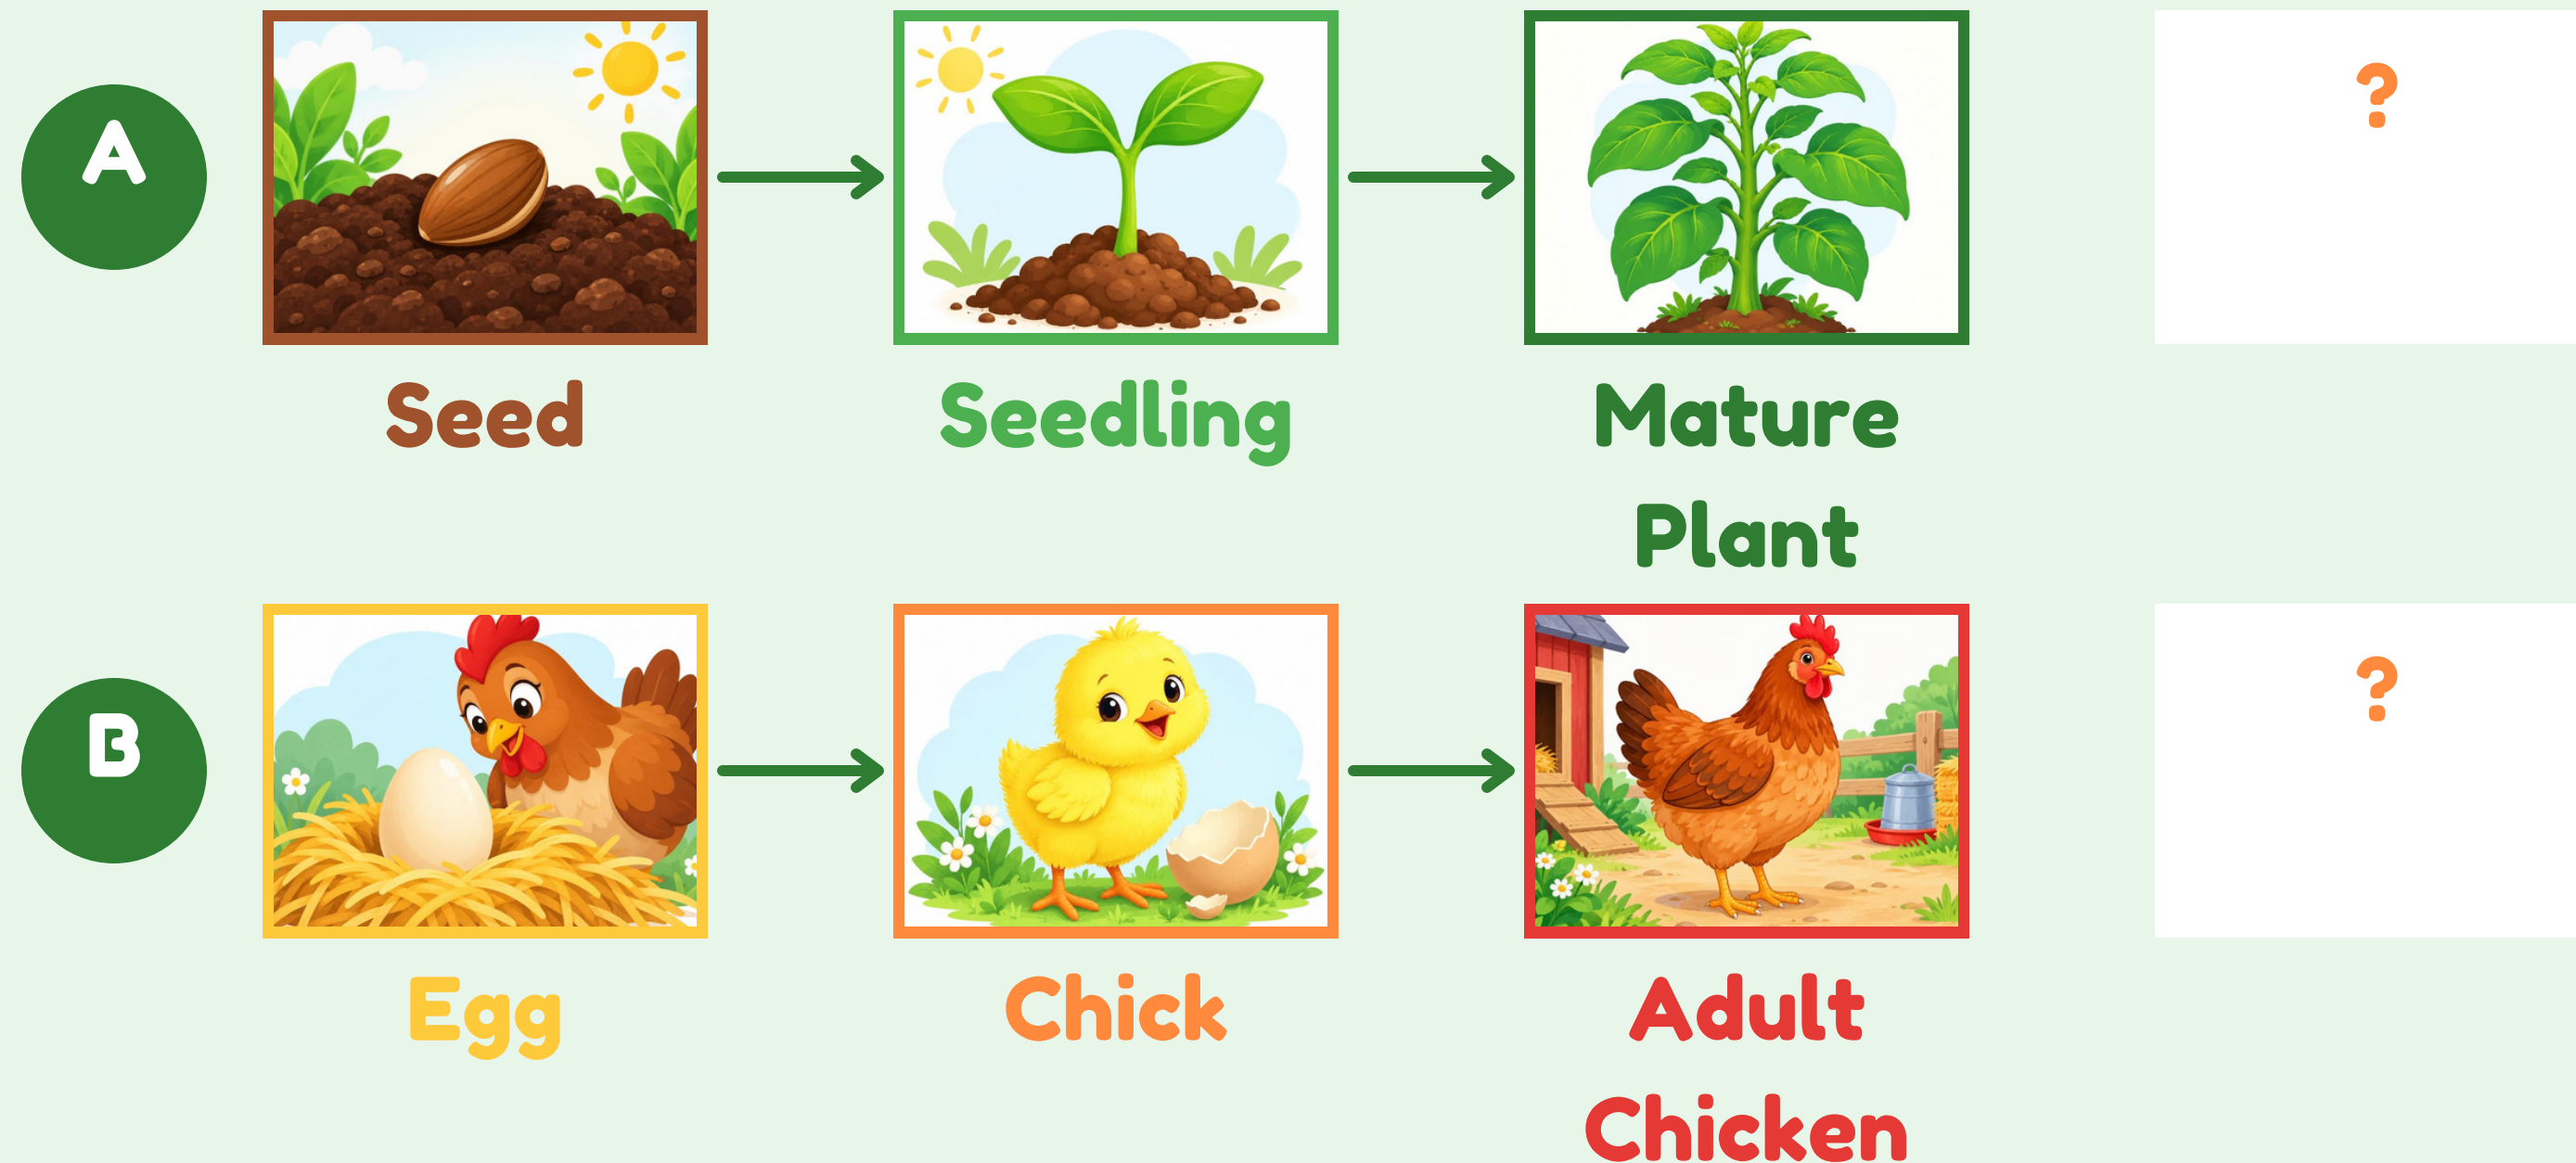

Stage # ___

Hint: Every life cycle starts small!

Whose Life Cycle?

 Look at each sequence. Which living thing does this life cycle belong to?

ACTIVITY 3

Compare It!

Find ONE thing chicken and butterfly cycles have in common, and ONE that's different.

CHICKEN

EggChickAdult Hen

...3 more stages between egg and adult

VS

BUTTERFLY

EggCaterpillarButterfly

...3 more stages between egg and adult (with metamorphosis!)

✓ ONE THING IN COMMON:

◆ ONE DIFFERENCE: -----

Assessment • Part 1

1 What is a life cycle?

- A) A type of bicycle
- B) The series of stages a living thing goes through as it grows and develops
- C) A kind of weather pattern
- D) The food chain in an ecosystem

2 Which is the correct order of a butterfly's life cycle?

- A) Larva → Egg → Adult → Pupa
- B) Egg → Adult → Larva → Pupa
- C) Egg → Larva → Pupa → Adult
- D) Pupa → Egg → Adult → Larva

3 What stage comes right after a seedling in a plant's life cycle?

Assessment • Part 2

1 Which organism starts life by hatching from an egg?

- A) Chicken
- B) Dog
- C) Cow
- D) Human

2 Why is reproduction important to living things?

- A) It makes them bigger
- B) It allows living things to produce new individuals and continue their kind
- C) It changes the weather
- D) It helps them eat more food

ANSWER KEY

How Did You Do?

B **Q1**

A life cycle is the series of stages a living thing goes through as it grows and develops.

C **Q2**

Butterfly order: Egg → Larva → Pupa → Adult.

A **Q3**

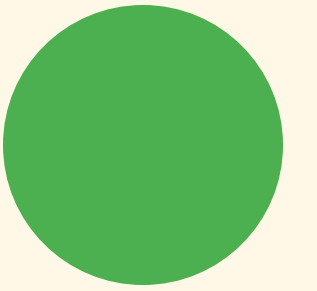

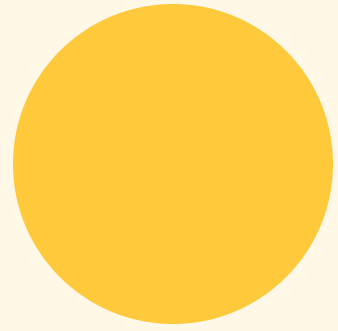

After a seedling, a plant grows into a mature plant.

A **Q4**

A chicken hatches from an egg.

B **Q5**

Reproduction lets living things produce new individuals and continue their kind.

Thank you!
